MRI LEFT SHOULDER

Findings:

The study reveals bony defect of posterosuperior part of head of humerus and tear of anteroinferior glenoid labrum.

Moderate joint effusion.

Acromio-clavicular joint is normal.

Tendons forming the Rotator cuff are normal - no focal hyperintensity is seen.

Surrounding muscle groups are normal.

Impression:

Bony defect of posterosuperior part of head of humerus and tear of anteroinferior glenoid labrum.

Moderate joint effusion.

NON-REACTIVE

Non-Reactive
Reactive

SAMPLE TYPE :SERUM

Remarks:-

Sample found to be reactive by the above screening test must be confirmed by standard supplemental assay, like western blot. Following factors are found to cause false positive HIV antibody test results: Naturally occurring antibodies, passive immunization, Leprosy, Renal Disorders, Tuberculosis, Myco-bacterium avium, Herpes simplex, Hypergamma-globulinemia, Malignant neoplasms, Rheumatoid arthritis, Tetanus vaccination, Autoimmune diseases, Blood Transfusion, Multiple Myeloma, Haemophilia, Heat treated Specimens, Lipemic serum, Anti-nuclear antibodies, T-cell leukocyte antigen antibodies, Epstein Barr virus, HLA antibodies and other retroviruses.

antigen), Immunochromatography

NON-REACTIVE

Non-Reactive
Reactive

SAMPLE TYPE :SERUM

Remarks:-

1. This is only a Screening test. All reactive sample should be confirmed by confirmatory test.
2. False positive results can be obtained due to the presence of other antigens or elevated levels of RF factor.
This occurs in less 1% of the sample tested.
